Office Action Summary	09/511,158	NAKAMOTO ET AL.				
and the second summary	Examiner	Art Unit				
The MAII ING DATE of this communication are	Jennifer A. Leung	1764				
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY THE MAILING DATE OF THIS COMMUNICATION.  - Extensions of time may be available under the provisions of 37 CFR 1.13 after SIX (6) MONTHS from the mailing date of this communication.  - If the period for reply specified above is less than thirty (30) days, a reply - If NO period for reply is specified above, the maximum statutory period w - Failure to reply within the set or extended period for reply will, by statute, Any reply received by the Office later than three months after the mailing earned patent term adjustment. See 37 CFR 1.704(b).	6(a). In no event, however, may a reply be till within the statutory minimum of thirty (30) day ill apply and will expire SIX (6) MONTHS from source the confliction to be seen to see the confliction to be seen to see the s	mely filed ys will be considered timely. In the mailing date of this communication.				
Status						
1) Responsive to communication(s) filed on 17 Ju	ne 2004					
l • .	action is non-final.					
3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is						
closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213.						
Disposition of Claims						
4)⊠ Claim(s) <u>1,2 and 6-11</u> is/are pending in the application.						
4a) Of the above claim(s) is/are withdrawn from consideration.						
5) Claim(s) is/are allowed.						
6)⊠ Claim(s) <u>1,2 and 6-11</u> is/are rejected.						
7) Claim(s) is/are objected to.						
8) Claim(s) are subject to restriction and/or election requirement.						
Application Papers						
9)☐ The specification is objected to by the Examiner.						
10)⊠ The drawing(s) filed on <u>23 February 2000</u> is/are: a)⊠ accepted or b)□ objected to by the Examiner.						
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).						
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).						
11)☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.						
Priority under 35 U.S.C. § 119						
	riority under 25 H O.O. 0.440()	(1)				
12)⊠ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a)⊠ All b)□ Some * c)□ None of:						
1. Certified copies of the priority documents have been received.						
2. Certified copies of the priority documents have been received in Application No. 09/242,903.						
3. Copies of the certified copies of the priority documents have been received in this National Stage						
application from the International Bureau (PCT Rule 17.2(a)).						
* See the attached detailed Office action for a list of the certified copies not received.

#### **DETAILED ACTION**

## Response to Amendment

1. Applicant's amendment submitted on June 17, 2004 has been received and carefully considered. Claims 3-5 are cancelled. Claims 8-11 are newly added. Claims 1, 2 and 6-11 remain active.

### Response to Arguments

2. Applicant's arguments filed on June 17, 2004 with respect to the rejection(s) of claim(s) 1, 2 6 and 7 under 35 U.S.C. 103(a) as being unpatentable over Schnock et al. have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further search and consideration, a new ground(s) of rejection is made in view of newly found prior art references.

# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 1764

3. Claims 1, 2 and 6-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rothert et al. (US 3,761,059) in view of Hohlbaum (US 4,244,923).

Regarding claims 1, 2, 6 and 7, Rothert et al. discloses a reactor comprising:

- a) a substantially horizontal cylindrical vessel (i.e., cylindrical closed reaction vessel 20) provided with an inlet at a lower part at one end thereof (i.e., inlet 22 for flowable material 23), an outlet at the lower part at the other end thereof (i.e., outlet 24 for material 23 discharge), and an outlet at the upper part thereof (i.e., for vapor or gas connection 50); (column 4, line 61 to column 5, line 18; FIG. 1); and
- b) a stirring rotor (i.e., agitating and propulsion apparatus 26) provided with a plurality of hollow disks (i.e., annular discs 220 to 220s) in the longitudinal direction thereof located within the cylindrical vessel 20, the hollow disks 220 to 220s being connected to each other by longitudinal stringers 116 that are welded to and pierce through the disks, each between adjacent hollow disks 220 to 220s at their peripheries (column 5, lines 19-28; FIG. 1, 2);

wherein stirring rotor **26** is without any rotating shaft at the position of a rotating center axis (FIG. 1, 2; column 2, lines 14-48; column 3, lines 53-62; column 5, lines 19-28) and is provided with a support member at one end of the stirring rotor (i.e., stub shaft **110** at inlet **22** end of the vessel; FIG., 1, 10) and another support member at the other end thereof (i.e., stub shaft **112** at outlet **24** end of the vessel; FIG. 1, 10); the outer diameter of the another support member **112** being smaller than the outer diameter of the stirring rotor **26** (see FIG. 1, 8, 10), and the another support member **112** further comprising scraping vanes (i.e., vanes of screw-shaped stripper **221**; FIG. 8) on the vessel inner end wall-facing side (i.e., facing the fixed opposing surface **222** of vessel **20**); (column 3, lines 29-39; column 6, line 65 to column 7, line 5).

Art Unit: 1764

Rothert et al. discloses the stirring rotor 26 being divided into a plurality of stirring blocks having structure based upon the viscosity of the liquid feed (i.e., by using disks 220 to 220s with larger holes or lattice interstices at one end of the apparatus than at the other; or by arranging the spacing between disks 220 to 220s closer to one another at one end of the apparatus than at the other; or by providing disks 220 to 220s which are more strongly inclined at one end of the apparatus than at the other); (see column 2, lines 55-68; column 3, lines 40-52; column 4, lines 16-32; column 7, lines 35-63).

Rothert et al. further discloses the longitudinal stringers 116 provided each between adjacent hollow disks 220 to 220s "can be given appropriate profiles for performing a scooping function," (column 4, lines 4-8), and illustrates an example of such profile in FIG. 4, wherein stringers 116 are configured as longitudinal stringers 117 provided with a U-shape cross section, for reinforcing the streak-flow of flowable material 23 on disks 220 to 220s and for reinforcing the formation of veil or film formation at the inner periphery of the discs, in the manner of scoop elements 225 (column 6, lines 25-46; see FIG. 9). Rothert et al., however, is *silent* as to whether the longitudinal stringers 116/117 may comprise scraping plates each between adjacent hollow disks 220 to 220s, for scraping the liquid feed attached to the inside wall of the vessel 20.

Hohlbaum teaches a contactor (FIG. 1, 1A, 5-7) comprising a stirring rotor provided with a plurality of axially spaced, circular discs 13 in a longitudinal direction thereof, placed within a cylindrical vessel (i.e., cylindrical drum 12), wherein the plurality of discs 13 are connected to each other by a plurality of "buckets 20", which are carried by and extend between each of the adjacent discs 13 at their peripheries. "Buckets 20" function essentially like the "U-shaped longitudinal stringers 117" of Rothert et al., by collecting the flowable material at the lower

Art Unit: 1764

portion of the cylindrical vessel and distributing the material at the upper portion of the cylindrical vessel, upon rotation of the stirring rotor. Additionally, Hohlbaum teaches the provision of plough blades 27 to the stirring rotor, the blades 27 extending from and forming a continuation of two diametrically opposed buckets 20 (see FIG. 5, 6), or provided as separate plates from the buckets 20 (see FIG. 7), and functioning essentially as the instantly recited "scraping plates". The plough blades 27 help avoid the formation of a stationary layer of solids in the annular passage 14 at the bottom of the drum 12, which can impede the flow of slurry through the contactor (column 3, line 67 to column 4, line 17).

It would have been obvious for one of ordinary skill in the art at the time the invention was made to provide the scraping plates as taught by Hohlbaum to the stirring rotor in the apparatus of Rothert et al., on the basis of suitability for the intended use and absent showing any unexpected results thereof, because the plates help avoid the formation of a stationary layer of solids at the bottom of the cylindrical vessel, as taught above.

Regarding claims 8-11, Rothert et al. discloses the outer diameter of the stirring rotor 26 is equal to the outer diameter of the hollow disks 220 to 220s (see FIG. 1 and 10).

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jennifer A. Leung whose telephone number is (571) 272-1449. The examiner can normally be reached on 8:30 am - 5:30 pm M-F, every other Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glenn A. Caldarola can be reached on (571) 272-1444. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
